1 PROBLEM (GATE 2021 (ST) Q.19)

Let $\{X_n\}_{n \geq 1}$ be a sequence of independent and identically distributed random variables each having uniform distribution on $(0,2)$. For $n \geq 1$, let

$$Z_n = -\log_e \left(\prod_{i=1}^n (2 - X_i) \right)^{\frac{1}{n}}.$$

Then, as $n \rightarrow \infty$, the sequence $\{Z_n\}_{n \geq 1}$ converges almost surely to _____ (Round of to 2 decimal places).

2 SOLUTION (GATE 2021 (ST) Q.19)

Let X and Z be random variables. X follows a uniform distribution from 0 to 2.

$$X \sim \mathcal{U}[0, 2], \quad (2.0.1)$$

$$\text{and let } Z = -\log_e(2 - X) \quad (2.0.2)$$

Simplifying Z_n , we have

$$Z_n = -\log_e \left(\prod_{i=1}^n (2 - X_i) \right)^{\frac{1}{n}} \quad (2.0.3)$$

$$= -\frac{1}{n} \cdot \log_e \left(\prod_{i=1}^n (2 - X_i) \right) \quad (2.0.4)$$

$$= \frac{1}{n} \cdot \left(\sum_{i=1}^n (-\log_e(2 - X_i)) \right) \quad (2.0.5)$$

As $n \rightarrow \infty$, the sequence $\{Z_n\}$ (Average value of $-\ln(2 - X_i)$) tends to the expectation value of the continuous distribution of Z .

$$\therefore \lim_{n \rightarrow \infty} Z_n = E(Z) \quad (2.0.6)$$

The CDF of Z is defined as

$$F_Z(z) = \Pr(Z \leq z) \quad (2.0.7)$$

$$= \Pr(-\log_e(2 - X) \leq z) \quad (2.0.8)$$

$$= \Pr(\log_e(2 - X) \geq -z) \quad (2.0.9)$$

$$= \Pr(2 - X \geq \exp(-z)) \quad (2.0.10)$$

$$= \Pr(X \leq 2 - \exp(-z)) \quad (2.0.11)$$

$$= F_X(2 - \exp(-z)) \quad (2.0.12)$$

The CDF for X ($F_X(x)$), a uniform distribution on $(0, 2)$ is given by

$$F_X(x) = \begin{cases} 0 & x < 0 \\ \frac{x}{2} & 0 \leq x \leq 2 \\ 1 & x > 2 \end{cases} \quad (2.0.13)$$

Substituting the above in (2.0.12),

$$F_Z(z) = F_X(2 - \exp(-z)) =$$

$$\begin{cases} 0 & 2 - \exp(-z) < 0 \\ 1 - \frac{\exp(-z)}{2} & 0 \leq 2 - \exp(-z) \leq 2 \\ 1 & 2 - \exp(-z) > 2 \end{cases} \quad (2.0.14)$$

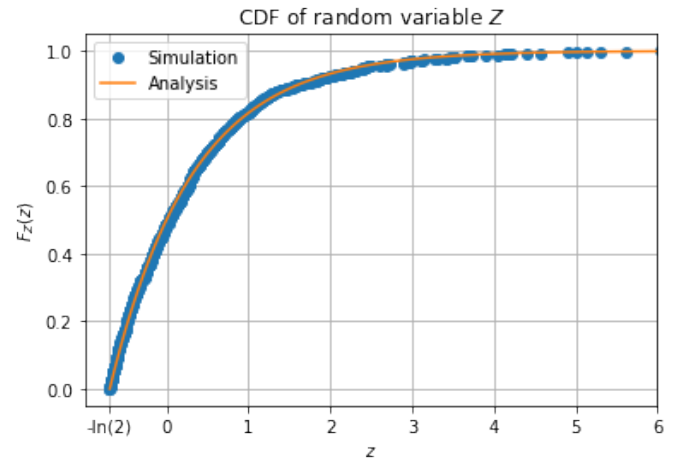

Fig. 0: $F_Z(z)$

After some algebra, the above conditions yield

$$F_Z(z) = \begin{cases} 0 & z < -\log_e(2) \\ 1 - \frac{\exp(-z)}{2} & z \geq -\log_e(2) \end{cases} \quad (2.0.15)$$

$$\Rightarrow f_Z(z) = \frac{d(F_Z(z))}{dz} = \begin{cases} 0 & z < -\log_e(2) \\ \frac{\exp(-z)}{2} & z \geq -\log_e(2) \end{cases} \quad (2.0.16)$$

Now calculating the expectation value for Z , we have

$$E(Z) = \int_{-\ln 2}^{\infty} z f_Z(z) dz \quad (2.0.17)$$

$$= \int_{-\ln 2}^{\infty} \frac{z e^{-z}}{2} dz \quad (2.0.18)$$

$$= \left[\frac{-(z+1)e^{-z}}{2} \right]_{-\ln 2}^{\infty} \quad (2.0.19)$$

$$= 1 - \ln(2) \quad (2.0.20)$$

$$\approx 0.3068 \quad (2.0.21)$$

From (2.0.6), we have as $n \rightarrow \infty$, $Z_n \rightarrow E(Z) = 0.3068 \approx 0.31$ (Rounded to 2 decimal places).

Ans: 0.31
